

Bat Facts

There are about 1,200 bat species.

Bats habitats have two basic requirements: roosts, where they spend the day or hibernate, and places for foraging.

Bat roosts can be found in hollow trees, crevices of rocks, inside plants, and even human-made structures; and "tents" that bats make by biting leaves.

Bats have poor visual ability, but none of them are blind.

Baby bats rely on the milk from their mothers. When they are a just few weeks old, they are expected to fly and hunt on their own.

Most bats are nocturnal creatures. They hunt during the nighttime hours. Their daylight hours are spent grooming, sleeping, and resting;

Three quarters of the world's bats are insect eaters. Each bat is typically able to eat one third of its body weight in insects each night, and hundreds of insects in a few hours.

If bats were to become extinct, the insect population would multiply and reach an alarmingly high number.
